the app should have a **complete character and production-continuity system**, not just a character image generator. Characters, voices, wardrobes, props and locations should be reusable assets that can move between studios.

Here's how I would structure it.

1. Character Studio — Identity &

Performance

Every character should have a permanent profile with:

Category	Features
Face	Face generation, face reference, facial identity lock
Appearance	Age range, skin tone, body type, height, hairstyle, eyes and distinctive features
Voice	Voice generation, voice cloning (with consent), voice selection and voice identity lock
Language	English, Nigerian Pidgin, Yoruba, Igbo, Hausa, French and other supported languages
Speech	Accent, pitch, tone, emotion, speaking speed and delivery style
Expressions	Smiling, crying, anger, fear, surprise and other facial expressions

|Clothing|Link characters to saved wardrobe designs|
|Consistency|Preserve the same face, body, appearance and voice across scenes|

Important: A character should have a permanent identity ID. Every generation referencing that character should use the saved identity rather than recreating a random look.

2. Motion Control Studio

This deserves its own dedicated studio.

Features should include:

- Reference-video motion transfer.

- Body movement and pose transfer.

- Facial expression transfer.

- Hand and gesture control.

- Walking, running, dancing and fighting movements.

- Camera movement control.

- Motion path and keyframe control.

- Character movement between positions.

- Reference-image-to-video animation.

Allow users to upload a reference video and transfer its movements to a selected character while preserving the character's appearance.

This is the type of functionality to target with motion-control models and technologies.

3. Wardrobe Studio

Create and manage clothing for characters.

- Generate clothing from text or reference images.

- Formal, casual, traditional, corporate, futuristic and costume categories.

- Shoes, accessories, jewellery and hairstyles.

- Save complete outfits.

- Assign outfits to individual characters.

- Maintain wardrobe continuity across scenes.

4. Props Studio

A dedicated library for objects used in productions.

- Cars, phones, furniture, weapons, bags, tools and household objects.

- Generate props from text or images.

- Save and reuse objects.

- Assign props to characters and scenes.

- Maintain object appearance across multiple shots.

5. Location Studio

Create reusable environments and filming locations.

- Houses, offices, streets, villages, cities and landscapes.

- Interior and exterior environments.

- Day, night, sunset and different weather conditions.

- Camera-angle references for the same location.

- Save locations and reuse them across scenes.

6. Cinema Studio — Complete Production

Cinema Studio should support multiple production formats, not just cinematic clips.

Production type	Suitable tools
Movies	Screenplay, scenes, characters, dialogue and shot planning
Music Videos	Song upload, beat analysis, visual scenes and performance shots
UGC	Creator characters, product references and social-media formats
Interviews	Interview framing, multiple cameras and dialogue
Documentaries	Narration, archival visuals, interviews and B-roll
Explainer Videos	Script, narration, graphics and animations
Montages	Music synchronization, transitions and shot sequences

Commercials	Product shots, advertising scripts and promotional scenes
Trailers	Dramatic sequences, music and sound effects
Short Films	Screenplay, character continuity and complete scene production

Cinema Studio screenplay features

This is particularly important for movie production.

- Screenplay editor with screenplay formatting.

- Scene and location management.

- Character assignment.

- Dialogue and narration.

- Action descriptions.

- Scene breakdown.

- Shot list generation.

- Camera angles and shot sizes.

- Storyboard generation.

- Shot-by-shot video generation.

- Continuity tracking.

- Voice assignment.

- Music and sound-effect placement.

- Final scene assembly.

A user should be able to import a screenplay and move from screenplay to storyboard, then shot generation and final video assembly.

7. How Everything Connects

The studios should share one production asset library.

For example:

A movie project

1. Create characters in Character Studio.

2. Generate their voices and assign languages.

3. Design their outfits in Wardrobe Studio.

4. Create their locations in Location Studio.

5. Create their props in Props Studio.

6. Import the screenplay into Cinema Studio.

7. Generate storyboards and shot lists.

8. Use Motion Control for character performances.

9. Generate individual shots.

10. Assemble the movie with dialogue, music and sound effects.

The same assets should also be available in Music Video, UGC, Documentary and Marketing projects.

Recommended SPACI6X studio structure

Studio	Main responsibility
Cinema Studio	Movies and cinematic production
Character Studio	Faces, bodies, voices and identities
Motion Studio	Motion transfer and movement control
Wardrobe Studio	Clothing and character outfits
Props Studio	Objects and production assets
Location Studio	Environments and filming locations
Storyboard Studio	Visual planning and shot sequences
Marketing Studio	Advertisements and UGC
Lip Sync Studio	Dialogue and lip synchronization
Effects Studio	Visual effects and

transformations|
|Canvas Studio|Connected AI model workflows|
|Editing Studio|Video, audio and final assembly|
so build the app around persistent creative assets and production projects. A character created once should remain available in every studio, with the same face, appearance, voice and assigned wardrobe. That continuity is what makes it useful for actual filmmaking rather than simply generating disconnected AI clips
